

Description

Thank you for purchasing a graphics card water block manufactured by aqua computer. The kryographics for Radeon RX Vega 64/Vega 56 has been specifically designed for graphics cards according to reference design of the chip manufacturer. The kryographics for Radeon RX Vega 64/Vega 56 effectively cools the RAM, voltage regulators and GPU of your graphics card. The base part of the water block is manufactured from pure copper for outstanding performance and durability.

Installation

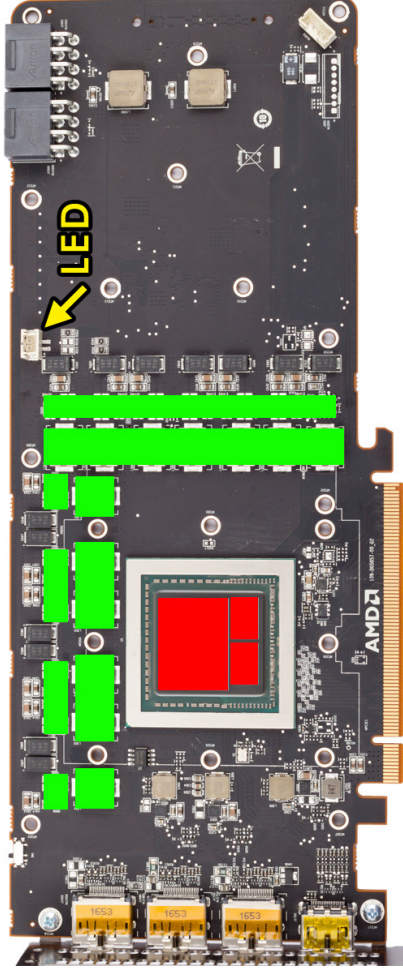

Step 1:

Remove the originally installed cooling unit from the graphics card. Use extreme caution not to damage any of the highly sensitive components of the graphics card! Disconnect the electrical connectors while lifting the cooling unit off the graphics card.

Step 2:

Remove all thermally conductive pads from the graphics card and clean all surfaces with direct contact to the cooling unit from remaining thermal compounds using benzene if necessary.

Apply a thin layer of thermal compound to the GPU with HBM memory. These areas are marked red in the figure. The thermal compound must not be electrically conductive! Cut fitting pieces from the thermally conductive pads supplied with the kryographics and place them on top of the components as indicated by green rectangles.

Step 3:

Attach the kryographics for Radeon RX Vega 64/Vega 56 to the graphics card. Start by connecting the LED cable to the connector indicated by the yellow arrow in the figure. Place the water block on top of the graphics card and carefully and evenly screw in the four screws adjacent to the GPU first, afterwards the remaining screws (thirteen screws M2.5x4 mm).

Optional: You can also re-use the original back plate. Use the original screws that had been used to attach the back plate.

Step 4:

Carefully check that the water block has level contact to all relevant components of the graphics card. Do not power on the graphics card or the PC if the cooler does not perfectly fit the graphics card! In this case, disassemble and repeat the mounting procedure. All screws must not be overly tightened to prevent the PCB from twisting!

Step 5:

Insert the graphics card to your PC and integrate the water block into your cooling system. Be sure not to connect any water blocks in parallel but only consecutively. A detailed instruction on building a water cooling system and plug&cool connectors as well can be found in the support/download section of our website www.aqua-computer.de.

Step 6:

Put the water cooling system into operation, but do not connect any other PC components to the mains supply! Check the water block as well as the fittings for leaks and do not put your PC into operation unless you can definitively eliminate the possibility of coolant leaking from the system! If any component has been in contact with coolant, do not put it into operation before it is completely dry again! For operating the graphics card, the water block must be correctly mounted and be connected to a water cooling system featuring adequate cooling performance! For corrosion inhibition, Double Protect Ultra must be used as coolant!

ATTENTION:

Disregarding the instructions may lead to severe damages! Aqua Computer GmbH & Co. KG cannot be held liable for damages or injuries resulting from improper installation or use of the product!

Thank you again for choosing an aqua computer product.
